

SYSTEM DEVELOPMENT PROPOSAL

Condominium Management System

A centralized platform for units, tenants, rentals, and property operations

Prepared for	Jomari Perez
Prepared by	Jose Irineo N. Iturralde
Proposal date	July 10, 2026

1. Executive Summary

This proposal outlines the design and development of a Condominium Management System for Jomari Perez. The system will provide one reliable place to manage condominium unit information, tenant records, rental agreements, payment tracking, maintenance concerns, and day-to-day property operations.

The proposed solution is intended to replace scattered spreadsheets, paper files, and manual follow-ups with an organized and searchable workflow. Authorized users will be able to see the status of every unit, identify occupied and available properties, review tenant and lease information, monitor rent obligations, and generate useful operational reports.

Proposed outcome A secure, easy-to-use management platform that gives the property owner a clear view of units, renters, contracts, collections, and outstanding concerns.

2. Business Need

Managing multiple rental units becomes difficult when information is stored in separate files or depends on memory and manual checking. Common challenges include incomplete tenant records, missed lease renewal dates, unclear payment histories, slow retrieval of documents, and limited visibility into vacant or occupied units.

The Condominium Management System will address these concerns by connecting the core rental management process in one platform. It will help the business maintain accurate records, reduce repetitive administrative work, and make better decisions using current information.

3. Project Objectives

- Create a complete and searchable record for every condominium unit.
- Maintain organized tenant, occupant, emergency contact, and rental information.
- Track rental dates, rental rates, deposits, payment status, and balances.
- Provide reminders or visibility for upcoming due dates and contract expirations.
- Record maintenance requests, actions taken, costs, and completion status.
- Give management a dashboard and reports for faster operational decisions.
- Protect business and tenant information through controlled user access and backups.

4. Proposed Solution

The solution will be a responsive web-based system accessible from modern desktop and mobile browsers. It will be designed around the client's actual rental workflow, with simple navigation and role-based access for the owner, administrator, or authorized staff.

Core Functional Modules

Module	Included capability
Dashboard	Summary of occupied, vacant, reserved, and unavailable units; upcoming rent and lease dates; open maintenance items; and key collection information.
Unit Management	Unit number, building or tower, floor, type, size, furnishing, rental rate, status, amenities, notes, photos, and related documents.
Tenant Management	Tenant and occupant profiles, contact details, identification references, emergency contacts, move-in history, and linked lease records.
Lease Management	Contract start and end dates, rental terms, deposits, billing schedule, renewal status, attachments, and lease history.
Rent and Payment Tracking	Expected charges, payment entries, payment dates, reference numbers, balances, status, and printable or downloadable records. Online payment processing is optional and separately scoped.
Maintenance Tracking	Issue details, priority, assigned person or vendor, work notes, cost, status, dates, and supporting photos or documents.
Document Management	Organized storage and retrieval of leases, identification documents, receipts, inspection records, and other files, subject to agreed storage limits.
Reports	Unit occupancy, rental income summary, unpaid or overdue accounts, expiring leases, tenant roster, maintenance history, and export-ready records.
User and Access Control	Secure login, user roles, account status, access restrictions, and basic activity records for important actions.

5. Typical System Workflow

Step	Activity	Result
1	Register unit	Create the unit profile and record its rental details, current condition, and availability.
2	Add tenant	Create the renter profile and attach the required contact and identification information.
3	Create lease	Link the tenant to a unit, enter the agreed terms, and upload the signed agreement.
4	Track charges and	Monitor expected rent, record payments, and view balances or overdue

Step	Activity	Result
	payments	items.
5	Manage concerns	Log maintenance issues and follow them through assignment, action, and completion.
6	Review and report	Use dashboards and reports to monitor occupancy, collections, contracts, and operations.

6. Scope and Deliverables

- Requirements confirmation and workflow review with the client.
- User interface and database design for the approved modules.
- Development of the responsive web-based application.
- Configuration of user roles and access permissions.
- Testing, issue correction, and user acceptance support.
- Initial deployment to the agreed hosting environment.
- Basic administrator orientation and user guide.
- Post-launch warranty support for defects within the agreed period.

7. Implementation Approach and Indicative Schedule

The schedule below is an initial estimate and will be finalized after the client confirms the number of units, required reports, user roles, data migration needs, integrations, and approval process.

Phase	Estimate	Main activities
1. Discovery and confirmation	1 week	Interviews, process review, requirements, priorities, and acceptance criteria.
2. Design	1-2 weeks	Wireframes, database structure, navigation, and client review.
3. Development	4-7 weeks	Approved modules, access control, reports, and iterative demonstrations.
4. Testing and acceptance	1-2 weeks	System testing, client testing, corrections, and approval.
5. Deployment and handover	1 week	Production setup, initial data support, orientation, and handover.

Indicative total Approximately 8-13 weeks from requirements confirmation, depending on final scope, review turnaround, data readiness, and third-party integrations.

8. Client Responsibilities

- Assign one authorized contact who can confirm requirements and approve deliverables.
- Provide sample unit, tenant, lease, payment, and report information in a safe and usable format.
- Review demonstrations and submitted items within the agreed feedback period.
- Confirm legal, privacy, retention, accounting, and receipt requirements applicable to the business.
- Provide or approve domain, hosting, email/SMS, payment gateway, and other third-party accounts when needed.
- Ensure that information supplied for migration is accurate and that the business has the right to use it.

9. Technical, Security, and Data Considerations

The final technical architecture will be selected after the hosting and operational requirements are confirmed. The system should use secure authentication, role-based authorization, encrypted network communication, input validation, protected credentials, routine backups, and practical audit records for sensitive actions.

Because the platform may store personal and financial information, the client and developer should agree on privacy notices, user access rules, document retention, backup ownership, breach handling, and compliance responsibilities before production use. No system can guarantee absolute security; security depends on the application, hosting environment, account practices, maintenance, and third-party services.

10. Investment and Payment Terms

Item	Price	Notes
Base system development	TBD	Approved core modules, testing, deployment, and basic handover.
Hosting and domain	TBD	State the hosting plan, billing period, storage, and renewal responsibility.
Optional features	TBD	Priced separately based on the selected enhancement and provider fees.

11. Assumptions, Exclusions, and Change Control

- This proposal is based on one condominium rental business and its authorized internal users unless otherwise stated.
- Final screens, fields, reports, workflows, and data migration volume will be confirmed during discovery.
- Historical data cleanup, encoding, and large-scale migration are excluded unless specifically included.
- Accounting, legal, tax, government, hardware, building access, and third-party integrations are excluded unless specifically included.
- Requests that change the approved scope, workflow, design, or integrations will be assessed for additional cost and schedule impact before work begins.
- The client will receive usage rights, source-code rights, or ownership rights only as stated in the final service agreement.

12. Warranty and Support

A suggested 30-day warranty period will begin upon production acceptance. During this period, defects that cause the delivered system to behave differently from the approved requirements will be corrected without additional development fees. New features, changed business rules, third-party service changes, data correction, user error, and infrastructure issues are outside the defect warranty and may require a separate quotation or support plan.

13. Next Steps

- Review this proposal and identify any required or optional features.
- Conduct a discovery meeting to confirm the client's current rental workflow and records.
- Finalize the scope, schedule, investment, hosting arrangement, and ownership terms.
- Sign the final service agreement and pay the agreed initial amount.
- Begin requirements confirmation and project design.

14. Proposal Acceptance

The signatures below indicate the parties' intention to proceed to a final service agreement based on the approved scope and commercial terms. This proposal does not replace a detailed contract, data-processing agreement, or other legal document required by either party.
